

Workshop Prerequisites

AWS Infrastructure & App Deployment Bootcamp

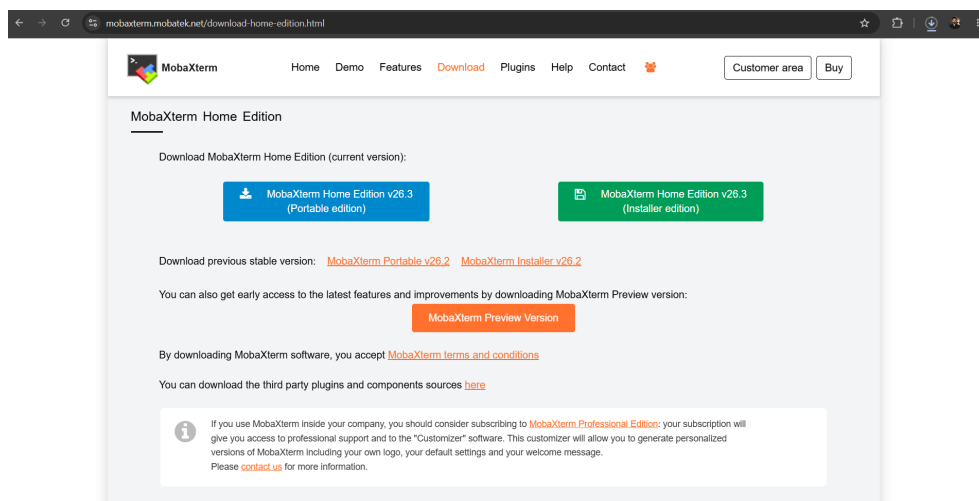

Before attending this workshop, ensure you are comfortable with the following topics. You do not need to be an expert — a basic working knowledge of each is sufficient to follow along with the hands-on sessions.

1. MobaXterm — Required Software (Download Before Workshop)

MobaXterm is the SSH client we will use to connect to the AWS server. Please download and install it on your Windows machine before the workshop.

Download link: <https://mobaxterm.mobatek.net/download-home-edition.html>

On the download page, click the **green button** (Home Edition Installer) to download the installer. Run it and complete the installation.

2. Git & GitHub

- Know how to clone a repository using git clone.
- Understand what a commit is and how to push changes to GitHub.
- Know what a branch is and how to switch between branches.
- Have a GitHub account ready with access to your organisation's repositories.

3. Python

- Comfortable writing and running basic Python scripts from the terminal.
- Understand functions, imports, and how to read a requirements.txt file.
- Know how to run a script: python app.py

4. Python Virtual Environment (venv)

- Understand what a virtual environment is and why dependency isolation matters.
 - Should have created one at least once: `python3 -m venv venv`
 - Know how to activate it: `source venv/bin/activate`
-

5. Nginx

- Awareness of what a web server is and what 'reverse proxy' means conceptually.
 - No prior configuration experience required — full setup covered in the workshop.
-

6. Linux / Ubuntu OS

- Basic terminal familiarity: navigating folders (`cd`, `ls`, `pwd`), running commands.
 - Know how to open a terminal and execute a command.
 - No advanced Linux knowledge needed — fundamentals are covered from scratch.
-

A 30-minute read or study of any unfamiliar topic before the workshop will get you familiar enough to follow along with confidence.
